The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in nammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The suspects or unknown descendants based on the hTR gene RFLP pattern. The suspects or unknown descendants or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cyclostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomera metabolism or telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    activity. The present sequence represents one of the PNA sequences of the

                                                                                                                                                                                                                                                     The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity or to detect and/or quantitate polynucleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The suspects or unknown descendants based on the hTR gene RFLP pattern. The suspects or unknown descendants or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase etivity. The present sequence represents one of the PNA sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*tag= a

mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of detect and/or quantitate polynucleoxide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of criminal cuspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (ADS) and associated pathologies, and other diseases characterised by abnormal telomerame etabolism or telomerase activity. The present sequence represents one of the PNA sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to peptide nucleic acids (PNAs), comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mammalian; peptide nucleic acid; probe; forensic; paternity testing; human telomerase RNA component; hTR gene RFLP pattern; cancer; inflammation; lymphoproliferative disease; autoimmune disease; neurodegenerative disease; neoplasia; hyperplasia; HTV; AIDS; human immunodeficiency virus; acquired immunodeficiency syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to peptide nucleic acids (FNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in cammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity or to telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoppicliferative diseases, autoinmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineophastic or oyfostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence represents one of the PNA sequences of the invention. Note: The present sequence represents SED ID No 1 but is shown as the first SEQ ID No 4 in table 1 (column 29)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mammalian, forensic, paternity testing, human telomerase RNA component, hTR gene RFLP pattern; cancer; inflammation; lymphoproliferative disease; autofimmune disease; neurodegenerative disease; neurojamina; hyperplasia; HIV; AlDS; human immunodeficiency virus; telomere metabolism; mutant; acquired immunodeficiency syndrome; cytostatic; anti-inflammatory;

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity or to detect and/or quantitate polynucleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of runknown descendants based on the hTR gene RFLP pattern. The PNAs an be further used for treating or identification of criminal such as the PNAs in combination with other pharmaceuticals (such as diseases. The PNAs in combination with other pharmaceuticals (such as intimoplastic or cycostatic agents) can be used for treating neoplasis, hymmal immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                               1. .13

```
The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the NTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as attended human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase of the activity. The present sequence represents one of the PNA sequences of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Shay Jw,
```

Polynucleotides, used to detect and isolate nucleic acids, inhibit function of RNA and telomerase enzymes and to treat e.g. viral infections, contain 2'-arabino-fluoronucleoside(8) linked to

nucleoside(s).

```
The present sequence is that of a N3'-P5' 2'-arabino-fluoro phosphoramidate oligonucleotide that is complementary to telomerase RNA. The Oligonucleotide was used to assess the relative efficacy of movel 2'-arabino-fluoro phosphoramidate oligonucleotides and their 2'-ribo fluorooligonucleotide counterparts (see AAH26728-35) for the inhibition of telomerase activity. Novel phosphoramidate 2'-arabino-fluoroligonucleotides are generally more acid stable, more resistant to cellular proteases, and also show greater telomerase inhibition activity than 2'-ribose-fluoro phosphoramidates. They are therefore useful for treating cancer (claimed) and other diseases in which telomerase activity is present at abnormal levels, such as hyperproliferative or autoimmune diseases e.g. psoriasis, rheumacoid arthritis, immune system disordere requiring immunosuppression, and in the treatment of viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2.9%; Score 13; DB 1; Length 13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     11-OCT-2001,
                                                                                                                                                                                                                                                                          Synthetic.
oligonucleotide that is complementary to telomerase RNA. The arabino-leotide was used to assess the relative efficacy of novel 2'-arabino-fluorophosphoramidate oligonucleotides and their 2'-ribose fluorooligonucleotide counterparts (see AAH26728-35) for the inhibition of telomerase activity. Novel phosphoramidate 2'-arabino-fluorophoramidate activity are generally more acid stable, more resistant to cellular proteases, and also show greater telomerase inhibition activity than 2'-ribose-fluoro phosphoramidates. They are therefore useful for treating cancer (claimed) and other diseases in which telomerase activity is present at abnormal levels, such as hyperproliferative or autoimmune diseases e.g. psoriaeis, rheumacioid arthritis, immune system disorders requiring immunosuppression, and in the treatment of viral infection
                                                                                                                                            2'-ribose-fluorooligonucleotide; phosphoramidate; telomerase; inhibitor; infection; cancer; diagnosis; therapy; cytostatic; virucide; antisense; antigene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotides, used to detect and isolate nucleic acids, inhibit function of RNA and telomerase enzymes and to treat e.g. viral infections, contain 2'-arabino-fluoronucleoside(s) linked to nucleoside(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a 2'-ribose-fluoro phosphoramidate
                                                                                                               Phosphoramidate-linked 2'-ribose-fluorooligonucleotide.
                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a monitation of breast, prostate or colon, mixed cell leukamia and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukamia, useful in treating tumour or in manufacturing a medicament for the treatment of tumour or in manufacturing a medicament for the diagnostic assays for detecting RNA or DNA. Inhibition of telomerase methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #18, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention
                                                              AAS15926;
                                                                                                                                                                                                                            Homo
                   AAS15926,
                                                The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as and in treating telomerase-mediated condition or disease, such as and in treating telomerase mediated condition or disease, such as Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in treatment of tumour. The polynucleotide inhibitors and therapeutic methods of treating cancer and other disorders involving inappropriate contivity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate diseases. Inhibition of telomerase in haematopoletic stem cells is useful for thmunosuppression and for selectively down-regulating specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase. For inhibiting telomerase activity in a cell adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkini a disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative expression of telomerase in inhibition of telomerase in inhibition of telomerase in inhibitor sequence represents human telomerase polynucleotide inhibitor #7, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

```
The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. (I) adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. (I) adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibition of telomerase chapters are and therefore in thibition of telomerase contivity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative consenses on the inmune system. The present sequence represents human branches of the immune system. The present sequence represents human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide useful for inhibiting telomerase activity in cells, or for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                   Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma; breast; prostate; colon; mixed cell leukaemia; Hodgkin's disease; fertility; inflammatory condition; tumour; cancer; veterinary; immunosuppression; telomerase inhibitor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #11, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "N3'-P5' phosphoramidate linkages"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 13 BP; 5 A; 2 C; 3 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a end in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophylactic and therapeutic expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynuclectide useful for inhibiting telomerase activity in cells, for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                       Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma; breast; prostate; colon; mixed cell leukaemia; Hodgkin's disease; fertility; inflammatory condition; tumour; cancer; veterinary; immunosuppression; telomerase inhibitor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #16, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity of proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a call and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #3, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide useful for inhibiting telomerase activity in cells, for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive call, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase.mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkini's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in treatment of tumour. The polynucleotide inhibitors of telomerase activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative confiseases. Inhibition of telomerase in haematopolitic stem cells is useful for immunosuppression and for selectively down-regulating specific confinences of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #4, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotide useful for inhibiting telomerase activity in cells, or for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                       Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma; breast; prostate; colon; mixed cell leukaemia; Hodgkin's disease; fertility; inflammatory condition; tumour; cancer; veterinary; immunosuppression; telomerase inhibitor; ss.

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenorated in the condition or disease, such as adenorated in the condition of disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate cypression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful for immunosuppression and for melectively down-regulating specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor \#6, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide useful for inhibiting telomerase activity in cells, for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma; breast; prostate; colon; mixed cell leukaemia; Hodgkin's disease; fertility; inflammatory condition; tumour; cancer; veterinary; immunosuppression; telomerase inhibitor; ss.

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell can in treating telomerase. Medicament for inhibiting telomerase activity in a cell and in treating telomerase. Medicate condition or disease, such as denocarcinoma of breast, prostate or colon, mixed cell leukaemia, cu seful in treating a tumour or in manufacturing a medicament for the treatment of tumour or in manufacturing a medicament for the cuseful in treating a tumour or in manufacturing a medicament for the diagnostic assays for detecting RNA or DNA. Inhibition of telomerase cutivity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate captisession of telomerase, and in treating veterinary proliferative confinences. Inhibition of telomerase in hamansuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human continuation and inhibitor #5, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide useful for inhibiting telomerase activity in cells, or for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                     Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma; breast; prostate; colon; mixed cell leukaemia; Hodgkin's disease; fertility; inflammatory condition; tumour; cancer; veterinary; immunosuppression; telomerase inhibitor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. Chodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase certivity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human constraint propersion in the method of

The thiophosphoramidate oligonucleotides retain a high RNA binding affinity and exhibit a much higher acid stability. They are useful for detecting a specific sequence in a sample, by forming a hybridisation complex with the sequence. They are useful for inhibiting function of an RNA in a cell (for inhibiting function of a medicament for treatment of the paratic of a medicament for treatment of virial in the preparation of a medicament for treatment of virial infection or cancer. The oligonucleotides are useful for anti-sense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and anti-gene diagnostic or therapeutic applications and may be used for treating telomerase-mediated conditions or diseases, such as

New oligonucleotide conjugate useful in the treatment of e.g. cancers are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to oligonucleotide conjugates where the oligonucleotide is covalently linked to an aromatic group. Compounds of the invention are used in medicine for inhibition of telomerase enzyme activity in cells (preferably expressed by tumour cells such as cells from cancer of the skin, central nervous system, retina and circulating tumours (e.g. leukaemia and lymphoma)). The present DNA sequence is an oligonucleotide used in conjugates of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Match phosphorothioate modified 2'-O-methyl RNA G-core oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence was synthesised in an example illustrating an invention relating to polynucleotides comprising a non-homopolymeric sequence of nucleoside subunits joined by at least one inter-subunit linkage that is a N3'-P5' thiophosphoramidate. The thiophosphoramidate oligonucleotides retain a high RNA binding affinity and exhibit a much higher acid stability. They are useful for detecting a specific sequence in a sample, by forming a hybridisation complex with the sequence. They are useful for inhibiting function of an RNA in a cell (for inhibiting translation of a mRNA or for inhibiting telomerase enzyme in a cell). They are also useful in the preparation of a medicament for treatment of viral infection or cancer. The oligonucleotides are useful for anti-sense and anti-gene diagnostic or therapeutic applications and may be used for treating telomerase-mediated conditions or diseases, such as hyperproliferative and autoimmune disorders, and for contraceptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                  Thiophosphoramidate oligonucleotide, virucide, cytostatic, immunosuppressive, contraceptive, RNA inhibitor, telomerase inhibitor; antisense therapy, viral infection, cancer, hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel thiophosphoramidate polynucleotide useful for detection of RNA or DNA having a given target sequence, for inhibiting RNA function in a cell, and for treating cancer and viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                           The invention relates to a novel chemically modified oligonucleotide having no more than about 27 nucleic acid base units. The oligonucleotide modulates mammalian telomere length. The chemically modified oligonucleotide of the invention may be useful for modulating the telomere length of a mammalian chromosome, inhibiting the division of a mammalian cell or modulating the effects of aging of a mammalian cell. The oligonucleotides may also useful for treating diseases associated with abnormal telomere length such as aging and hyperproliferative conditions including cancer. The current sequence is that of the "match" phosphorotion modified 2'-O-methyl RNA G-core oligonucleotide of the invention.
                                                                           New chemically modified oligonucleotides, useful for modulating telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell, or modulating the effects of aging of a mammalian cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                **tag= c

                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel chemically modified oligonucleotide having no more than about 27 nucleic acid base units. The oligonucleotide modulates mammalian telomere length. The chemically modified oligonucleotide of the invention may be useful for modulating the telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell or modulating the effects of aging of a mammalian cell. The oligonucleotides may also useful for treating diseases associated with abnormal telomere length such as aging and hyperproliferative conditions including cancer. The current sequence is that of the "match" 2'-0-methyl oligonucleotide / peptide nucleic acid of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mammalian hair growth comprises applying telomerase inhibitor to
                                                                                                                                                                                             New chemically modified oligonucleotides, useful for modulating telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell, or modulating the effects of aging of a mammalian cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of telomerase inhibitor VI, an example a telomerase inhibitor useful in the method of the invention for reducing

unwanted mammalian (human) hair growth. A composition comprising the telomerase inhibitor is applied to the skin to reduce hair growth. The telomerase inhibitor acts by reducing telomerase levels in hair follicles, reducing telomerase mRNA expression or by promoting the erosion of telomeric DNA. It can be used to reduce hair growth of a woman with hirsutism or to reduce androgen stimulated hair growth (both claimed). A composition comprising a telomerase inhibitor reduces hair growth by at least 15% (preferably 20%) when tested in the Golden Syrian
                                                                                                                                                                                                                                                 Hamster assay

Novel covalent oligonucleotide conjugates comprising nucleobase and oligonucleotide exactly complementary to sequence within template region of human telomerase RNA, linked through linker, useful as medicine for cancer. treating

Disclosure; SEQ ID NO 3; 50pp; English

activity, comprising a nucleobase (A) and oligonucleotide (O) containing activity, comprising a nucleobase (A) and oligonucleotide (O) containing a sequence of 2-11 nucleotides exactly complementary to a sequence within the the terminance of thuman telomerase RRA, linked through a linker (L). A compound of the invention has cytostatic activity. The compound is useful for inhibiting the activity of telomerase enzyme, which involves contacting the telomerase with the compound. The compound of the invention is also useful for inhibiting the proliferation of the cell is which involves contacting the cell with the compound. The cell is treating cancer. The compound is useful for inhibiting or reducing the compound is useful for inhibiting or reducing telomerase activity e.g., tumour cells. The telomerase-positive tumour cells are from cancer of the skin, connective tissue, adipose, breast, lung, stomach, pancreas, ovary, cervix, uterus, kidney, bladder, colon, prostate, central nervous system (CNS), retina and circulating tumours The invention relates to a novel compound having telomerase inhibition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for manufacturing a labelled nucleic acid which comprises introducing an 11C to the transduction region and contacting the nucleic acid fragment and 11C compound, where the nucleic acid fragment is a polynucleic acid or peptide nucleic acid. The method of the invention may be useful for manufacturing a labelled nucleic acid and provides sensitive detection of a target mRNA, such neuroglia myclibril acidic protein (GFAP). The current sequence is that of the labelled nucleic acid/11C-related PNA-antisense oligo 2 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          by introducing carbon-11 to
nucleic acid fragment and carbon-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
(such as leukaemia and lymphoma). The present sequence represents an oligonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for manufacturing a labelled nucleic acid which comprises introducing an 11C to the transduction region and contacting the nucleic acid fragment and 11C compound, where the nucleic acid fragment is a polynucleic acid or peptide nucleic acid. The method of the invention may be useful for manufacturing a labelled nucleic acid and provides sensitive detection of a target mRNA, such neuroglia myofibril acidic protein (GFAP). The current sequence is that of the labelled nucleic acid/11C-related PNA-antisense oligo 1 of the
                                                                                                                                                                                                                                                                                                      Manufacturing labeled nucleic acid, by introducing carbon-11 to transduction region, and contacting nucleic acid fragment and carbon-11

The invention relates to a novel method for diagnosing and treating a patient (suspected of) having a solid tumour that produces folate receptor alpha (Rr-alpha), comprising administering a folate receptor receptor alpha (Rr-alpha), comprising administering a folate receptor alpha inducer comprising at least one steroid receptor agent, optionally together with one or more histone deacetylase inhibitors. The folate receptor alpha inducer increases levels of the receptor on plasma membranes of tumour cells and in at least one type of body fluid. Also claimed as part of the invention are: a method for diagnosing or therapeutically treating a patient comprising activating the folate receptor alpha (RR-alpha) gene in the patient using at leat one of an agonist or antagonist of cestrogen receptor (ER), progesterone receptor (PR), androgen receptor (AR) or glucocorticoid receptor (ER); A method of constantially increasing folate receptor (ER), type alpha expression in a tumour using at least one steroid receptor agent in a manner selective to FR-alpha-positive tissues; and finally a method to enhance comprising use of at least one steroid receptor agent that binds to FR-alpha; and a serum marker for diagnostic screening and monitoring of cancers during and after treatment comprising use of at least one steroid receptor. A method of the cancers during and after treatment comprising and monitoring of cancers during and after treatment comprising at esettor activity. The methods are useful in diagnosing and treating a patient with, or suspected of having, at least one solid tumour. The present sequence represents a human G/C-rich (Spl binding)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, c-raf, A-raf, B-raf, hammerhead ribozyme; hairpin ribozyme;

```
The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence was used to illustrate the invention.
                                                                                                              /mod_base= OTHER
/note= "2',4'-oxyethylene linkage in the sugar residues
and phosphorothioate backbone"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stable 2',5'-oligoadenylic acid analogs containing natural and modified nucleic acid units as well as unusual phosphate groups with excellent activity particularly antitumor, applicable in cancer or antiviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Galanin receptor; GALR1; human; single nucleotide polymorphism; SNP; drug discovery; haplotyping; infectious diarrhoea; growth hormone deficiency; allele-specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Galanin receptor gene GALR1 allele-specific oligonucleotide #46

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method has been developed to the system a random library of mucleic comprises: (a) introducing into the system a random library of mucleic acid catalystes (MAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalystic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutch RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV90922 to AAV93877 repersent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method has been developed for the identification of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                      The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI of an individual, in the indentity of the nucleotide pair at come or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious distributions and growth hormone deficiency, to validate GALRI as a candidate agent for treating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to compounds targeting GALRI activity. The method is useful to compounds the expression and function of GALRI, and in expressing GALRI protein for use in screening for candidate drugs to treat diseases related to GALRI activity. The polymucleotide or variant is useful for studying expression of the polymucleotide or variant is useful for studying expression of the biological activity of GALRI as well as on the binding the affantity of candidate drugs terrepression on the biological activity of GALRI as well as on the binding confining and for studying the effect of the variation on the biological activity of GALRI as well as on the binding caperesent human GALRI gene allele-specific cligonucleotides used to accept the capered of the capered of the method of the capered of the method of the capered of the cape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                             Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lecithin-cholesterol acyltransferase; LCAT; Norum disease; gene therapy;

The present invention relates to a new polynucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference sequence which is a polymorphic variant of a reference is useful for lecithin-cholesterol acyltransferase (LCAT). The invention is useful for identifying an association between a trait (preferably a clinical response to drug targeting LCAT) and at least one genotype or haplotype of LCAT gene. The method of the invention has applicability in developing diagnostic tests and therapeutic treatments for Norum disease. It haplotyping and genotyping methods are useful for studying population if ineage at the phenotypic level, paternity testing, forensic applications and for identifying association between the LCAT genetic applications and for identifying association between the LCAT genetic applications trait such as level of drug response or susceptibility to disease. In caddition, the methods for identifying the LCAT haplotypes present in cindividuals are useful in the development of drugs targeting LCAT. For example, determining the frequency of individual LCAT haplotypes in a copulation with a specific disease, e.g. Norum disease, will facilitate the development of drugs targeting the LCAT isoform(s) that are most trepresent in that disease population. The present nucleic acid sequence trepresents one of a collection (ABK97492-ABK9515) of individual expecience.
Novel isolated polymorphic variant polynucleotide of lecithin-cholesterol acyltransferase gene, useful for studying expression and biological function of the gene, and for therapeutic, diagnostic or forensic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that were used in the invention to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; cholesteryl ester transfer protein; CETP;
single nuclectide polymorphism; SNP; drug screening; atherosclerosis;
cardiovascular disease; hypercholesterolaemia;
allele specific oligonuclectide; 88; probe.

                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                               The invention comprises the amino acid and coding sequences of the human cholesteryl ester transfer protein (CETP), the invention also comprises polymorphisms identified within the CETP gene. The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA sequence represents an allele specific oligomucleotide probe for the
                                                                                                 New isolated polynucleotide useful for haplotyping and/or genotyping cholesteryl ester transfer protein (CETP) gene in an individual or in screening for drugs useful in treating diseases associated with CETP

                                                                                                                                                                       Primer DP966 (AAT14404) is specific to porcine reproductive and respiratory syndrome virus (PRRSV). It was used with other sequencing primers (AAT1431-182) to determine the sequences of the putative membrane (M) and nucleocapsid (N) genes of PRRSV isolate ISU-12 (see also AAT14391-92) and of 5 other American PRRSV isolates (AAT14405-09) and Buropean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of exprhiropolatin, granulocyte colony stimulating factor protein and
New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

The sequences given in AAT80211-382 represent synthetic oligonucleotides which are complementary to a portion of the 5' untranslated region (UTR) of hepatitis C virus (HCV). These sequences may be used in a pharmaceutical composition for the control or prevention of HCV infection. They may be used to inhibit replication or expression of HCV in a sample. They may be used to inhibit HCV in the control or expression of HCV in thibit HCV replication in a cell and are therefor useful in the treatment of HCV infections such as chronic and acute hepatitis and hepatocarcinoma. This sequence forms multiplex binding complexes with regions of the HCV genome. This sequence forms a duplex at the region - 227 and forms a purine strand triplex at the region - 212 to -222
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            go:nucleotide(s) complementary to HCV 5' untranslated region - used intreatment and detection of HCV infection, esp. hepatitis and hepato-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule, that modulates human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                 The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to

The invention describes synthetic oligonucleotides complementary to a portion of the 5' untranslated region of hepatitis C virus. The oligonucleotides may be used in methods for controlling, preventing, and treating hepatitis C virus infection, in antisense technology and gene therapy, and of detecting the presence of hepatitis C virus in a sample. Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded RNA virus which infects hepatocytes. HCV is the major cause of non-A, non hepatocellular carcinoma. The invention describes methods and kits for inhibiting replication of HCV, inhibiting the expression of HCV nucleic acid and protein, and for treating HCV infections. This sequence represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting HCV replication and expression of HCV

                                                                                                                                                                                 The invention relates to a novel isolated nucleic acid molecule comprising a variant gene associated with an eating disorder and selected from any of 119 polymorphisms with their corresponding genotyphism in the dataset, alleles and HGBASE identification, given in the specification. The novel nucleic acid molecule has polymorphisms in the serotonin receptor ID, delta-opioid receptor, or dopamine receptor D2, which is useful in diagnostic and prognostic assays for eating disorders, in particular ancreaxia nervosa and bulimia nervosa. This polymucleotide sequence represents a serotonin receptor ID probe of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New substantially pure ribonucleic acid (RNA) complex comprising a first strand and a second strand that hybridize to each other, useful for treating cancer, systemic lupus erythematosus, Alzheimer's disease or
                                                                                                         New nucleic acid molecule having polymorphisms in the serotonin receptor 1D, delta-opioid receptor, or dopamine receptor D2, useful in diagnostic and prognostic assays for eating disorders, such as anorexia and bulimia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   98; RNA complex; immunosuppressive; cytostatic; cancer;

This invention relates to double stranded ribonucleic acid (RNA)

Structures and constructs. Specifically, it comprises first and second

Structures and constructs. Specifically, it comprises first and second

EXA strands that hybridise to each other under physiological conditions

to form a double-strand region, wherein the double-strand region contains

one or more mismatched regions that result in two or more double-stranded

segments. Furthermore, the mismatched regions may be cleaved by single-

strand ribonuclease enzymes. The present invention describes expression

vectors that encode daRNAs with an intron containing exemplary target

cetrois that encode daRNAs with an intron containing exemplary target

therapy, these RNA complexes exhibit immunosuppressive and cytostatic

cetivities and can be used to treat cancer, systemic lupus erythematosus,

Alzheimer's and Huntington's disease. The cancer is selected from,

melanoma, brain tumour, leukaemia and lymphoma. This oligonuclectide

sequence is a DNA flanking sequence used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antiviral; phosphorothioate; mRNA 4; mRNA 5; herpes simplex virus 1; HSV; viral infection; HIV; varicella zoster virus; VZV; therapy; 89.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

            antiviral activity. These sequences, and the phosphorothioate oligonuclectides represented by AAT12418-T12434 (which are complementary to regions of the mRNA 4 or 5 of herpes simplex virus I (HSV)), are effective in the prevention and treatment of viral infection. The sequences are especially effective against infection by HSV, HIV or varicella zoster virus (VZV)

The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeins synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize; corn; Zea mays; delta-9 desaturase; GBSS; target; substrate; granule bound starch synthase; hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; se.

                                                                                                                                                                                                                                                                 Detection of mutation(s) in the BRCAl gene - by hybridisation with an allele-specific oligo:nucleotide or by amplification, useful particularly for breast or ovarian cancers.
                                                                                                                                                                                                                                                                                                                      AAV20567-V20574 are probes used in a method to detect mutations in the ... human BRCA1 gene. Such mutations are used for classifying a tumour for diagnostic and prognostic purposes or detecting a predisposition of higher susceptibility to breast and ovarian cancer in an individual. The methods can be used for reducing the high incidence and mortality women at high risk. These women, once identified, can be targeted for more aggressive prevention programmes
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Leukocyte Antigen (HLA)-DRB sequences. The primers are used in the methods of the invention. The specification describes a method for determining the HLA class II group type of a subject. The method for determining the HLA class II group type of a subject. The method comprises amplifying a target DNA sample from a subject using a particular HLA group-specific primer pair and determining whether a nucleic acid product is produced, therefore identifying the group type. Methods for determining the HLA class allele type of a subject are also described, where a specific HLA group-specific exon region primer pair is used. The methods are useful for determining the HLA class II type of a getermining the group precific alleles present and determining the group specificatly of alleles. The methods are diagnostically useful for histocompatibility analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                   Determining the Human Leukocyte Antigen Class II type Histocompatibility antigens - by using new intron-specific oligonucleotide primers for sequence specific primer PCR and sequencing.

class II (HLA Class II) group type of a subject the method comprises:

(i) amplifying a target DNA sample from a subject using a particular HLA group-specific primer pair (sequence specific primer PCR - SSP-PCR); and group-specific primer pair (sequence specific primer PCR - SSP-PCR); and claimed by the group type. AAX00305 to AAX00305 tepresent specifically claimed oligonucleotide primer for use in the above method. These oligonucleotides are useful for determining the HLA Class II type of a patient sample, by identifying the specific alleles present and etermining the group specific alleles. Steps (i) and (ii) in the method are diagnostically useful for histocompatibility analysis to see if donor and recipient groups match. The new sequences are useful for providing an insight into the genetic relationship between different angency of HLA Class II genes. The high resolution, nucleic acid based primer be indight the intron-specific primers is more efficient than prior art methods using exon based primers, as few exon sequences offer conserved primer binding sites, resulting in a limited number of primer pairs and the primer specificity for alleles, as allelic variations exist between the primer sites. The SSP-PCR method allows separation of haplotypes in the primer sites. The SSP-PCR method allows separation of cis-trans linkages of partences are useful for any and the primer sites. The sylventy cannot be achieved with other primers.
                                    Determining the Human Leukocyte Antigen Class II type Histocompatibility antigens - by using new intron-specific oligonucleotide primers for sequence specific primer PCR and sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotide, multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 6'-end, the 3'
codons, mixtures. The antisense oligonucleotides may be derived
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
diseases (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.

                                                                                                                                                                                                                                                                                                                                                             The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets concletic acids involved in bronchoconscriction, allergies, and/or inflammation. The ON can have antinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasis to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the carcinomas, and effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing conchoconstriction and inflammation. AAA3313 to AAA3312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID No:11 to 1885 from the present invention. N.B. Sequences given in the disclosure of the present invention on the disclosure of the present invention of onct match is the interest given in the disclosure of the present invention do not match is the interest given in the sequences given in the sequences given in the sequences given in the sequences given in the esquences given in the disclosure of the present invention do not match the interest and prostates and prostates given in the disclosure of the present invention do not match the sequences given in the disclosure of the greatest sequences given in the disclosure of the greatest sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; human; airway disorder; bronchoconstriction; lung inflammatory; immunosuppressive; antisthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pann; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

The present invention describes low authoring why content and the antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base.

(I) can have respiratory, bronchodilator, antihiflammatory, analgeat, immunosuppressive, antiaethmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with activating peptide factors and malignancies, auch as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-apecific anzymes, chemokines, addesion molecules and their receptors, central nervous and non-nervous system control nervous system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasocative peptides and receptors, binding proteins and malignancy associated proteins. The receptors, binding proteins and malignancy associated disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or condition and formulance associated with a disease or condition and formulance associated with a disease or condition and formulance associated with a disease or conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The invention relates to the construction of a vector which comprises a multiple number of Shear Stress Response Elements (SSRE) from various can gene promoter sequences and one or more genes, antisense molecules, cribozymes, double stranded RNA, or a nucleic acid which encodes a cribozymes, double stranded RNA, or a nucleic acid which encodes a cribozymes, double stranded RNA, or a nucleic acid which encodes a control of the protein which inhibits the synthesis of, or activity of the protein or peptide. This sequence represents the SSRE sequence from the promoter of the platelet-derived growth factor A (PDGF-CC A). The vector is useful for stimulating or inhibiting vascular permeability or seen of interest is custing the formation, maturation or regression of blood vessels, or inhibiting genes or proteins involved in a diseases, down regulating angiogenesis and for treating vasculogenic angiogenesis and for treating vasculogenic angiogenesis. These disorders include cardiovascular disorder, neoplastic disorders, is chaemia, atheresclerosis, hypertension, diabetes, hypercholesterolaemia
                                                                                                            Expression vector comprising multiple shear stress response elements, useful for modulating endothelial cell proliferation, stimulating or down-regulating angiogenesis and treating vasculogenic/angiogenic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             checkpoint kinase-1; Chk1; antisense; ribozyme; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mcswiggen J, Booher RN, Holman PS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                         Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
         downregulating the expression of the human checkpoint kinase-1 (Chk1) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 geruseful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                       Gaps

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neutite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) properties or a maberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA cross of CD20 in the presence of a divalent cation that is preferably Mg^2+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more characters. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-thody inmunnocytoma (NHL), immunocytoma (NHL), immunocytoma (NHL), immunocytoma (MCL), imm

```
presence of a divalent cation that is preferably Mg^2^+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), darkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease sequence is a hammerhead ribozyme of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; b-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO). The regulates expression of a neurite growth inhibitor gene (NGO). The concleic acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motifi), a G-cleaver (cleaving RNA with a NYM motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motifi). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+.

CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+.

CC FURTHERMORE, it may be contacted with a call to reduce CD20 activity of the CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-clear lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-cleaker lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, leukaemia, HIV (human immunodeficiency virus) associated MHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small secolated with the level of tragetting nucleic acid may be contacted with a cell to reduce NGOs activity of the collicia call may be used to contacted with a cell to reduce NGOs activity of the collicia acid may be used to create central nervous system (CNS) injury and creates NGOs activity of second collicia call may be used to create central nervous system (CNS) injury and creates of one or more collinear central nervous system (CNS) injury and creates of creates which respond to the meurodegenerative creates which respond to the neurodegenerative 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; D20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; g-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; MCL; immunocytoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; centebrotypascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; parkinson's disease; ataxia; Huntington's disease; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.

WO200159103-A2

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNAzyme; inozyme; dever; amberzyme; inozyme; lincyme; lincyme; lincyme; lincyme; lincyme; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphom; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; cerebrovascular dystrophy; neurodegenerative disease.

Human NOGO Hammerhead Ribozyme #58.

12-MAR-2002 (first entry)

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down capuates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule an amberzyme (Cleaving RNA with an NGW niple!), a zinzyme (cleaving RNA with an NGW triple!), a zinzyme (cleaving RNA with a cell low-grade or follicular non-leukaemia, HV (human immunodeficiency virus) associated NHL, immunocytoma (IMC), smail B-cell lymphomy (LI), immunocytoma (IMC), smail B-cell lymphocytic lymphomy (CC tragetion asystem (IMC), smail B-cell lymphocytic lymphomy (I
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          muscular dystrophy, and/or other neurodegenerative disease hich respond to the modulation of NOGO expression. The present

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neutite growth inhibitor gene (NDGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an enadolytic nucleic acids (e.g. a ribozyme or a maberzyme). The CD20 tergetting nucleic acid is used to cleave RNA with a NYN mouth? properties and north mouth? The CD20 tergetting nucleic acid is used to cleave RNA with a YGY motif). The CD20 tergetting nucleic acid is used to cleave RNA vith a YGY motif). The CD20 tergetting nucleic acid is used to cleave RNA clear the reat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 tergetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HV (human immunodeficiancy virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodeficiancy virus) associated NHC, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodeficiancy virus) associated NHC, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodeficiancy virus) associated NHC, lymphoma, immunodeficiancy virus) associated vith the level of nucleic acid may be contacted with a cell to reduce Of one or more therapies. In particular, immunocytoma (CNS) injury and cerebrone of a l

GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
           Chemotherapy-induced neuropathy, amyorrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, returifieldt Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Domain

Nucleic acid encoding human UDP-GalNAc:polypeptide N-cetylgalactosaminyltransferase 10 protein is useful to diagnose, prevent and treat disorders associated with reduced or over expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated nucleic acid (I) encoding a human UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTaee 10, EC 2.4.1.41) protein. Human pp-GaNTaee 10 is located to chromosome 7411.2. (I) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or treat a disorder associated with decreased expression or activity of pp-GaNTaes. The sequences given in ABV85011 to ABV86689 and ABPS530 to The sequence data for this patent is not represented in the printed specification of the present invention. N.B. specification but is based on sequence information supplied by the

                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.
Nucleic acid encoding human UDP-GalNAc:polypeptide N-cetylgalactosaminyltransferase 10 protein is useful to diagnose, prevent and treat disorders associated with reduced or over expression of the encoded protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated nucleic acid (I) encoding a human UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, EC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7q11.2. (I) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or treat a disorder associated with decreased expression or activity of pp-GaNTase. The sequences given in ABV85011 to ABV86689 and ABP33502 to ABP53504 are given in the exemplification of the present invention. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide caving a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modification, an LNA modification, two or more consist of o-methyl modification, an LNA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for conference of these modifications of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abjotic stress tolerance, improved cutritional value (e.g. altering amino acid content of plants with desired conferring amino acid over production), herbicide resistance (e.g. altering amino acid content of plants eresistance).

Conferring amino acid over production), herbicide resistance (e.g. altering amino acid over production), citazine resistance, conference modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral content (e.g. increased starch or production of waxy starch), altered floral content (e.g. reduced palmitate, increased stearte or reduced linolent acid).

Constitutional value of seaso useful for producting albino mutants for the altering of increases are sequence represents a genome of altering of increases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 2 A; 5 C; 7 G; 3 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the invention

Kim J; Rice MC, 01-JUN-2000; 2000US-0208538P. 30-OCT-2000; 2000US-0244989P. 27-MAR-2001; 2001US-00818875. 01-JUN-2001; 2001WO-US017672. Gamper HB, (UYDE) UNIV DELAWARE. Kmiec EB,

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production.

WPI; 2002-106307/14.

Claim 7; Page 87; 220pp; English.

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide CC flaving a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide are useful for consist of o-methyl modification, an LNA modification, two or more phosphorothioate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved conferring amino acid over production), herbicide resistance (e.g. altering amino acid over production), herbicide resistance (e.g. glyphosate resistance, imidazolinome and sulphonylurea herbicide, cresistance, porphyric herbicide resistance or triazine resistance), disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid).

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Eaving's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, vertuca valgaris, angiofibroma of tuberous sclerosis, port-whom stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treatment. The method comptises the use of one or more therapies the treatment. The method comprises the use of one or more therapies the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a

Novel polynucleotide which down regulates expression of Ets-related gen useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

(I) is useful for treating conditions selected from cancer, Imphoma, Ewing's sarcoma, melanoma, neovascular angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca Wulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
ERG gene, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; 88;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (1) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (1) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (1) is useful for reducing ERG activity in a cell, by contacting the cell with (1). (1) is useful for cleaving RNA of ERG gene, by contacting (1) with RNA, in the presence of a divalent cation such as Mg2+. (1) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnosit tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (1) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ARXI314-ABK22719 represent nucleic acide, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and carginate expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH1.1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB8399), a sequence having 65$ sequence identity to (SI), (SI) having 95$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSH1 is a proteo-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for for identifying a specific binding partner. (I) and mucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and traating caused by altered expression of human POSH11 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomorleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or

protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB31999), a sequence having 65% sequence identity to (S1), acids (S1) ABB31999), a sequence having 65% sequence identity to (S1), acids (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contribuous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GrPases as well as daptor protein that interacts with Rho family small GrPases as well as daptor protein that interacts with Rho family small GrPases as well as considered components of the signal transduction pathway. (I) is useful for or identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSHL1 including disease and treating caused by altered expression of human POSHL1 including diagnosing and treating causeful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomore of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
                                                                                                  The invention relates to an isolated SH3 domain (POSH)-like signalling nrotein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino comprising a sequence of 730 amino comprising a sequence of 730 amino compression (POSHL 1) polypeptide (I), comprising a sequence of 730 amino compression (POSHL 1) polypeptide (I), comprising a sequence of 730 amino compression (POSHL 1) polypeptide (I), compress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inoko H, Kagiya T, Ichihara T, Matsumura Y, Moriya S, Nishida M;

oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-claaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleocides and a 3' end modification of a 3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis.

encephalitis, myocarditis, meningits, neurologic infection, hepatitis, liver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of mammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least tive ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                     Сарв

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepaticis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNASyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleotides and a 3 end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 370 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis.

encephalitis, myozaccalitis, meningnitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMAZyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, least three of the S' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, meningits, neurolegic infection, hepatitis, meningits, neurolegic infection, hepatitis, meningits, neurolegic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2-O-methyl modifications, phosphorochioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gapa

                                                                                                                                                                                                                                                                                 The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 572.1, mDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 1601.2 and MDZ12 and MDZ12 is encoded at chromosome 1602.7 and MDZ12 and MDZ12 and MDZ12 and useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful as therapeutic agents for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ7; MDZ1; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                 acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABE25889 - ABE26216, ABE265531, ABE26520 - ABE26524, ABE26530 - ABE26520 - ABE26524, and ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acid also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
                                                The invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or panoreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ65531, ABZ65520 - ABZ65524,
shown in ABZ59889 - ABZ65216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
ABZ66530 - ABZ66585 represent substrate/target sequences for the human
ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - ABZ66585 represent substrate/target sequences for the human
